U.S. Patent and Trademark Office PTOL-303 (Rev. 7-05)

Continuation of 11. does NOT place the application in condition for allowance because: Applicant argues that Cummings fails to teach monitoring the gas condenstion as required by both claims 13 and 20, and that the secondary references do not overcome this deficiency and that no motivation exists for their combination, the Examiner would disagree. Applicant argues that one would not be motivated to recirculate the exiting gas of Cummings because it is primarily water vapor, however the Examiner would disagree and point out that carrier gas is required to carry the hydrogen peroxide into the system and Cummings and both Childers are clearly analagous in that respect, with the Childers references simplifying carrier gas supply through recirculation. It is noted that both Childers address drying the gas prior to recirculating to remove excess water vapor which would clearly function with Cummings system. It is further noted that Childers '794 clearly teaches maintaining a given saturation level within the chamber to achieve a given condensation, and specifically monitors the relative humidity for such saturation levels, as well as the sterilant concentration, temperture and pressure within the system in order to control the continued injection of hydrogen peroxide based on those parameters, such control being combined with and improving upon the control recited by Cummings (see the bottom of column 6 through line 15 of column 7 of Childers '794 as well as column 3, lines 40-55 and column 4, lines 20-60 of Cummings). The combination of Cummings and the Childers references is proper and fully covers all instantly claimed limitations.
